

Methyldiethanolamine

Organic amines are corrosion control agents that increase pH and scavenge corrosive contaminants. Methyldiethanolamine (MDEA), for example, as a widely-used corrosion inhibitor that eliminates hydrogen sulfide and helps control pH in oil and gas amine units. On-site monitoring of rich and lean amine can help maintain appropriate corrosion protection, extending system lifetime and avoiding costly corrosion-induced shutdowns and failures. With OndaVia's %-level test kits, you can quickly and easily measure MDEA levels in rich and lean amines solutions to maintain unit performance.

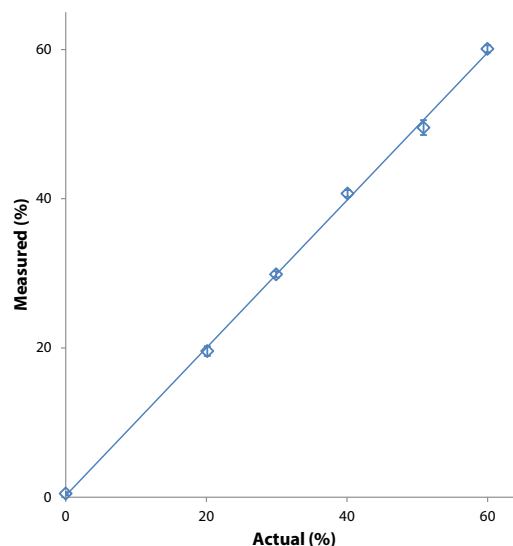

Specifications

Accuracy: $\pm 1\%$

Range: 30% to 60%

Count: Ten (10) cartridges per box
